

STORMWATER PROGRAM

Post Construction
Site Runoff
Minimum Control
Measure

On February 1,2011; ADEM issued phase 2
of The University of Alabama, NPDES
stormwater discharge permit.

As a part of the UA discharge permit, EHS has developed a stormwater management plan which is composed of six elements.

Post construction site runoff control is one of the six minimum control measures.

The Best Management Practices (BMPs) for the post construction site runoff control measure are:

- Plan review
- Protection of sensitive waters
- Local interaction

PLAN REVIEW

Construction Administration will review plans to determine if post construction runoff from new and/or redevelopment will adversely affect water quality.

Plans and methods will be revised to ensure compliance with stormwater guidelines.

SENSITIVE WATERS

The 303(d) list of impaired waters will be regularly reviewed to determine if the section of the Black Warrior River receiving stormwater from UA outfalls is listed.

As of today, our section of the Black Warrior is not listed as an impaired body of water.

LOCAL INTERACTION

The city of Tuscaloosa also has a phase 2 NPDES stormwater discharge permit. As adjacent permittees, there is an amount of interaction and cooperation which is necessary.

Information related to the post construction site runoff control measure will be included in the annual report.
