Perchloric Acid: Guidance for Laboratories

Perchloric Acid is a clear, odorless liquid that is stable at room temperature. It is highly volatile and requires special precautions when in use, handled, or in the working vicinity. At 150° C and above, or at a concentration greater than 72%, perchloric acid is a strong oxidizer and eventually becomes unstable. At concentrations below 72%, perchloric acid is a highly corrosive. Substitution of perchloric acid with a less hazardous chemical or a dilute solution of less than 48%, if applicable, is recommended. Use of an amount 48% or greater requires close supervision or a knowledgeable, skilled person to perform the work. This document serves as guidance to all users of perchloric acid ensuring proper and safe use within laboratories.

- **Hazards**
  - At a highly corrosive concentration, perchloric acid may cause severe burns to the eyes, skin, and mucous membranes upon contact.
  - Many hazards involve potential explosions and/or fire.
    - When heated, vapors produced can condense within fume hood ventilation ductwork potentially causing dangerous formation of explosive perchlorates.
    - Contact with organic materials such as cotton, wood, paper, etc. may cause an explosion or fire once the perchloric acid dries.
      - Note that clothing is also made of organic material.
    - Perchloric acid must not be distilled in a vacuum as this may form an unstable anhydride causing a spontaneous explosion.
  - Many chemicals will produce reactions with perchloric acid including:
    - Acetic anhydride
    - Alcohol
    - Reducing agents
    - Metals such as sodium, calcium, and lithium
    - Incompatible greases

- **Protection**
  - Principle investigators must ensure that all personnel working with or around perchloric acid are properly trained and knowledgeable regarding hazards and safety procedures.
    - Must be familiar with the chemical safety data sheet (SDS). This can be found online (see references section also).
  - Personal Protective Equipment includes:
    - Eye protection: Splash-proof safety goggles.
    - Gloves: Polyvinyl chloride (PVC) or neoprene.
    - Face shield: Worn with safety goggles.
• Lab coat
• Ventilation: Fume hood must be designated for use of perchloric acid.
  • Metal-free
  • Shatter-proof glass
  • Procedures using a concentration of 50% or less, without heating, may be used in a standard fume hood.
  • Procedures using a concentration greater than 50% with heating must be used in a perchloric acid fume hood with a wash down feature.
  • Always lower the fume hood sash when working.
  o Laboratory personnel must be familiar with the location and operation of safety features.
    • Eyewash/drench hose
    • Safety Shower
  o Perchloric acid quantity within the laboratory should be limited to a one-pound reagent bottle.
    • Should remain in the original glass container and in a glass/ceramic secondary containment tray in case of spills.
    • The reagent bottle should be rinsed with water after use and returned to secondary containment tray.
    • Should be separated from other chemicals, but it can be stored with other corrosive inorganic acids in a corrosive-resistant cabinet.
      • Perchloric acid is incompatible with the following:
        o Organic chemicals
        o Flammable or combustible materials
        o Dehydrating agents such as sulfuric acid
  o Use non-reactive plastic or preferably glass when working.
    • NEVER use metal.
  o Use only glass-to-glass apparatuses and silicon-based lubricants for joints.
    • Do not use rubber stoppers, tubes, or stopcocks.
    • All glass apparatuses should be rinsed with water after perchloric acid work.
  o Do not allow perchloric acid to freeze or dry.
  o Dispensing and transfer methods:
    • Use a dispensing burette or a reaction flask to measure out the quantity of perchloric acid needed.
    • Always transfer the perchloric acid over secondary containment to catch any spills that may occur.
  o In the event of a spill, the following steps should occur:
    • Immediately dilute the spill with large quantities of water
- Spread sodium bicarbonate to isolate the spill. Be careful when utilizing bases to neutralize strong acids. The heat produced can inadvertently cause formation of vapors.

- Mop and rinse with water repeatedly if the spill occurs on a wooden surface.

- A second neutralization with sodium bicarbonate is recommended.

- Do **NOT** use organic materials to clean up the spill such as paper towels, cotton rags, and kim wipes.
  - Organic materials may spontaneously ignite upon contact.
  - If organic materials are inadvertently used, wet the material with water and place into a sealed plastic bag.

- **When heating perchloric acid:**
  - This should only be performed in a perchloric acid hood, not a standard fume hood.
  - Hot plates, electric mantles, steam baths, or steam-heated sand baths are acceptable means of heating.
    - Gas flames or oil baths should **NOT** be used.

- **When disposing of perchloric acid:**
  - **NEVER** mix the unwanted waste with other chemical waste.
    - Perchloric acid waste should have a designated waste container properly labeled with hazardous waste labels provided on the UA EHS website.
    - Do not accumulate large quantities of waste.
      - Contact EHS for a chemical waste pick up (see references section).

- **Emergency Procedures for Exposure**
  - Immediately provide first aid based on the chemical SDS instructions.
  - Seek medical attention as soon as possible.
    - A copy of the SDS should be taken with the exposed person for quick treatment.

• **Training**
  - EHS requires in-person training for use, handling, and storage of hydrofluoric acid in laboratories on UA campus.

  For further questions, contact the [EHS Laboratory Safety Team](#).
